New vaccine formulation, useful for preventing and treating plasmodium infection in a patient, comprises malaria antigen and immunostimulatory CpG oligonucleotide.

Claim 8; Page 16; 22pp; English.

The present invention describes a vaccine comprising a malaria antigen and an immunostimulatory CpG oligonucleotide. This is useful in the prevention and treatment of malaria caused by Plasmodium falciparum infection

This single-stranded oligonucleotide is one example of an immunostimulatory sequence containing a palindrome. It increases mouse NK cell activity significantly more strongly than a control 45mer with no palindromic sequence. A fragment corresponding to nucleotides 1-30 of this sequence (i.e. contg. the palindrome) had a stronger effect on augmenting NK cell activity than nucleotides 16-45 fragment (i.e. lacking the palindrome). A fragment with nucleotides 16-45 fragment (i.e. lacking T(I) were inverted (i.e. T(10), (3(11) - n opalindrome) had a weaker effect on increasing NK cell activity than the unchanged 1-30 sequence. The full-length 45mer containing the palindrome also induces CSF and has
                                                                                                                                                                                                                                                                                   complementary strand sequence is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This double-stranded oligonucleotide is one example of an immunostimulatory sequence containing a palindrome. It increases mouse NK cell activity. There was little difference between the immunostimulatory activity of the double-stranded and single-stranded version of this activity of the double-stranded and single-stranded version of this acquence (see AAQ20698 for ss), e.g. NK cell activity is 47.5 (plus/minus 3.7) in the presence of 100 microcy/ul of the de-oligo, 44.0 (plus/minus 2.1) for the ss-oligo and 14.2 (plus/minus 0.5) for the control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "palindrome, i.e. complementary strand sequence is identical reading 5'-3'"

The region corresponding to nucleotides 438-751 encoding the M.tuberculosis 65kD antigen is highly conserved among mycobacteria. DNA tragments having at least 70 per cent homology to this region and to the corresponding region from other species (e.g. M.bovis - see AAQ57761) are claimed. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                            The region corresponding to nucleotides 438-751 encoding the M.tuberculosis 65kD antigen is highly conserved among mycobacteria. DNA fragments having at least 70 per cent homology to this region and to the corresponding region from other species (e.g. M.microti, see AAQ57762) are claimed. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mycobacterium DNA fragments - corresp. to 65-kD antigen sequences, and primers and probes for detecting Mycobacterium spp.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes an improvement to a method requiring the administration of interferon alpha (IFN-alpha), involving administering an immunostimulatory nucleic acid (ISNA). The sequences of a number of such nucleic acids are also provided. These may comprise oligonucleotides with phosphorothicate backbones, palindromes, or G-rich sequences. The sequences of the invention are useful in the treatment of proliferative diseases, such as cancers, and viral infections. The present sequence is

The present invention provides a pair of primers for specifically amplifying a heat shock protein 65 (hsp 65) gene fragment of mycobacterial species comprising those sequences shown in ACF04316-ACF04317. Also provided are a number of hsp65 gene fragments, mainly from mycobacterial species. The methods and compositions of the present invention are useful for amplifying hsp 65 gene of mycobacterial species, and identifying and diagnosing mycobacterial species in tuberculosis infection. The present sequence is a gene fragment of the invention
                                                                                                                                                                                                                                                                                              Primers for amplifying a heat shock protein 65-gene fragment mycobacterial species, useful for identifying and diagnosing mycobacterial species in tuberculosis infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mycobacterium; hsp65; heat shock protein 65; identification;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence corresponds to the mycobacterial gene which encodes a 65KD antigen of the group of tuberculosis bacteria. Regions within this sequence can be used as primers to amplify mycobacterial genes and detect mycobacteria. Antibodies can be induced by immunisation with the DNA sequence or its fragments. These can also be used to detect mycobacteria in assays such as ELISA or RIA procedures. See also AAQ6505-Q06506, AAQ66508-Q06513 and AAR09336. (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           amplifying a heat shock protein 65 (hsp 65) gene fragment of mycobacterial species comprising those sequences shown in ACF04316-ACF04317. Also provided are a number of hsp65 gene fragments, mainly from mycobacterial species. The methods and compositions of the present invention are useful for amplifying hsp 65 gene of mycobacterial species, and identifying and diagnosing mycobacterial species in tuberculosis infection. The present sequence is a gene fragment of the invention
                                                                                                             The present invention provides a pair of primers for specifically amplifying a heat shock protein 65 (hsp 65) gene fragment of mycobacterial species comprising those sequences shown in ACF04316-ACF04317. Also provided are a number of hsp65 gene fragments, mainly from mycobacterial species. The methods and compositions of the present and identifying and diagnosing mycobacterial species, and identifying and diagnosing mycobacterial species in tuberculosis infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides a pair of primers for specifically amplifying a heat shock protein 65 (hsp 65) gene fragment of mycobacterial species comprising those sequences shown in ACF04316-ACF04317. Also provided are a number of hsp65 gene fragments, mainly from mycobacterial species. The methods and compositions of the present invention are useful for amplifying hsp 65 gene of mycobacterial species, and identifying and diagnosing mycobacterial species in tuberculosis

The present sequence encodes a fusion protein comprising a Mycobacterium bovis heat shock protein (Hsp) 65 fused at its C terminal to a HBV16 E7 protein. The fusion protein is used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Th1 cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp55, Hsp40, Hsp10, Hsp50, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial
                                                                                                                                                                                                                                                                                                     Screening for compounds that stimulate Thl-like responses in CD4+lymphocyte cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 888;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides a pair of primers for specifically ampair shock protein 65 (hap 65) gane fragment of mycobacterial species comprising those sequences shown in ACF04316-ACF04317. Also provided are a number of hap65 gene fragments, mainly from mycobacterial species. The methods and compositions of the present amoventon are useful for amplifying hap 65 gene of mycobacterial species, and identifying and diagnosing mycobacterial species in tuberculosis infection. The present sequence is a gene fragment of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         vrotein; Hsp; Th1 response; Th1 cell; CD4+ T lymphocyte cell;

Vaccine of recombined albumen for preventing and treating infection of human hepatitis C virus. ##X8X0000000000X8

Example 1; Page 14; 54pp; Chinese.

The invention relates to a recombinant protein vaccine which is a fusion protein of BCG vaccine's heat shock protein 65 and the core antigen of multi-epitope hepatitis C virus. Also claimed is the amino acid sequence and nucleotide sequence for coding it, the expression carrier containing nucleotide sequence, the host cell containing expression carrier, the preparing process of recombinant protein vaccine, the vaccine containing recombinant protein for preventing and treating hepatitis C and a method for detecting the activity of specifically killing T-lymphocytes by the hepatitis C induced by vaccine and its cell model are disclosed. The present sequence represents a HSP65 DNA.

screening New antisense nucleic acids, useful for identifying proteins or s for homologous nucleic acids required for cellular proliferation isolate candidate molecules for rational drug discovery programs.

Claim 14; SEQ ID NO 26142; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense

ö K. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at Gaps .; 0 8; Length 1620; Sequence 1620 BP; 321 A; 489 C; 571 G; 239 T; 0 U; 0 Other; Indels nucleic acid; (2) a host cell containing the vector; 7 DB Score 31.8; DE Pred. /note="Vector: pBluescript II SK-; Site_I: EcoRI; Site_2:
Xho1; This library, constructed by John Davies and Jeffrey
McDermott, combines constructed by John Davies and Jeffrey
McDermott, combines constructed by John Davies and Jeffrey
mid-log phase in TAP (acetae-containing) medium in the
light, TAP medium in the dark, HS (minimal) medium in the
light, TAP medium in the dark, HS (minimal) medium in
ambient levels of CO2 and HS medium bubbled with 5% CO2.
PolyA mRNA was purified from each sample, pooled and CDNA
synthesized. The cDNA was directionally cloned into lambda
ZAP II (Stratagene) in the EcoRI (5') and XhoI (3') sites.
pBluescript II SK- plasmids were excised from the lambda
ZAP clones by superinfection with ExAssist (Stratagene)
phage. The library was normalized using method 4 described
in Bonaldo et al (1996) Genome Research 6: 791-806."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CVYDD522

Scoring table:

```
Oligonucleotides containing at least 1 unmethylated CpG dinucleotide affect the immune response in a subject by activating natural killer cells or redirecting a subject of immune response from a Th2 to a Th1 response by inducing monocytic and other cells to produce Th1 cytokines. These nucleic acids containing at least 1 unmethylated CpG can be used as

The method is for treating a subject having, or at risk of having an acute decrement in air flow, comprising administering a nucleic acid sequence containing at least one administering a nucleic acid sequence containing an unmethylated CpG dinucleotide affect an immune response in a subject by activating natural killer cells (NK) or redirecting a subject by activating natural to a Thi response by inducing monocytic and other cells to produce Thi cytokines. They can be used to treat pulmonary disorders having an dimunologic component, such as asthma or environmentally induced airway disease. They can also be used to treat diseases associated with Grampositive bacterial infections or endotoxaemia including bacterial.
                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          meningitis, neonatal sepsis, cystic fibrosis, inflammatory bowel disease and liver cirrhosis, Gram-negative pneumonia, Gram-negative abdominal

ANY27641-751 represent immunostimulatory oligodeoxyribonucleotides (ODNs)

C f the invention. The ODNs contain at least one unmethylated CpG

dinucleotide, and have the formula: 5' NIXIGGARN2 3', where at least one

ucleotide separates consecutive CpGs, X1 is adenine, guanine, or

thymine, X2 is cytosine or thymine, N is any nucleotide and N1+N2 is 0-26

C thymine, X2 is cytosine or thymine, N is any nucleotide and N1+N2 is 0-26

C or more than one CGG or CGG trimer OR 5' NXIX2CG3X4M3', where at least

C on more than one CGG or CGG trimer OR 5' NXIX2CG3X4M3', where at least

C one nucleotide separates consecutive CpGs, X1 and X2 are selected from

CGT, GpG, GpA, ApT and ApA, X3and X4 are selected from TpT or CpT, N is

any nucleotide and N1+N2 is 0-26 bases with the provision that N1 and N2

does not contain a CCGG tetramer or more than one CGG or CGG trimer. The

CODNs activate lymphocytes in a subject and redirect a subject's immune

C response from a Th2 to a Th1 (e.g. by inducing monocytic cells and other

CC cells to produce Th1 cytokines, including monocytic cells and GM-CSF).

CT the ODNs can be used to treat or prevent an asthmatic disorder,

autoimmune diseases, in desensitisation therapy, as an artificial

CC humber of a disperse or an ammmal such as a mouse or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

thuman Paker. The Investion comparises Stimulating an immune response in a subject comprising administering to a subject exposed to an antigen, an immunopotentiating cytokine and an immunostimulatory CpG oligonucleotide considers and a subject exposed to an antigen, an immunostimulating an antigen specific immune response. The methods are useful for treating cancer by stimulating an antigen specific immune response. The methods are including but not limited to: sarcoma, carcinoma, fibroma, inhumans, including but not limited to: sarcoma, carcinoma, fibroma, inhumans, including but not limited to: sarcoma, carcinoma, fibroma, inhumans, including but not limited to: sarcoma, carcinoma, fibroma, inhumbans, including but not limited to: sarcoma, carcinoma, fibroma, inhumbans, including but not limited to: sarcoma, carcinoma, fibroma, inhumbans, including but not limited to: sarcoma, carcinoma. The methods are also useful for treating infectious diseases. The methods may also be used to treat allorgic diseases, e.g. asthma. The methods and compositions may also be applied to treat cancer and tumours of non human subjects, e.g. cate and dogs. Neoplasias affecting agricultural livestock may also be treated by the bacterium contagious diseases of sheep and goats caused by the bacterium contagious diseases of sheep and goats caused by the bacterium contagious diseases of sheep and goats caused by the bacterium contagious diseases of sheep and goats caused by the bacterium contagious diseases of sheep and goats caused by the bacterium contagious diseases of sheep and goats caused she an adjuvant in cubeful in activating B cells, M cells, and antigen presenting cells, conjunction with tumour antigens to protect against a tumour challenge
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequences AAZ41856-241949 are phosphorothioate CpG oligonucleotides which are used in the invention to induce interleukin-12 (IL-12) secretion from human PBMC. The invention comprises stimulating an immune response in a
                                                                                                                                                                                                                                    CpG oligonucleotide; phosphorothioate; interleukin-12; IL-12; secretion;

Sequences AAZ41856-Z41949 are phosphorothioate CpG oligonuclectides which are used in the invention congrises stimulating an immune response in a subject comprising administering to a subject exposed to an antigen, an subject comprising administering to a subject exposed to an antigen, an immunopotentiating cytokine and an immunostimulatory CpG oligonucleotide con immunopotentiating cytokine and an immunostimulatory CpG oligonucleotide con immunopotentiating cytokine and an immunostimulatory CpG oligonucleotide con specific antigen specific immune response against a cancer antigen. The methods can also be used to treat neoplastic disorders in humans, including but not limited to: sarcoma, carcinoma, fibroma, Lymphoma, melanoma, neuroblastoma, retinoblastoma, and glioma. The methods are also useful for treating infectious diseases, and glioma and also be used to treat allergic diseases, e.g. asthma. The methods and compositions may also be applied to treat cancer and tumours in non human subjects, e.g. cats and dogs. Neoplasias affecting themselved and compositions may also be treated and include leukaemia, heamangiopericytoma and bovine ocular neoplasia. Chronic, infectious, contagious diseases of sheep and goats caused by the bacterium contagious diseases of sheep and goats caused by the bacterium correct of the means, also he treated and contagious under contagious diseases of sheep and goats caused by the bacterium correct of the contagious diseases of sheep and contagious diseases of sheep and contagious diseases.
                                                                                                                                                                CpG oligonucleotide; phosphorothioate; interleukin-12; IL-12; secretion;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel synergistic combinations of immunostimulatory oligonucleotides and immunopotentiating cytokines are useful for stimulating the immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  caused by jaagslekte may also be treated. Op oligonucleotides can be useful in activating B cells, NK cells, and antigen presenting cells, such as monocytes and macrophages. Op oligonucleotides enhance antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          dependent cellular cytotoxicity and can be used as an adjuvant in
conjunction with tumour antigens to protect against a tumour challenge
                                                                                                                                                                                    human PBMC, immune response, cancer; HIV; bacterial disease; asthma; neoplastic disorder; jaagsiekte; B cell; NK cell; 85; cytokine; antigen presenting cell; infection; allergic disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100.0%; Score 20; DB 2; Length 20;

This sequence represents a CpG adjuvant that can be used in the vaccine composition of the invention. The vaccine comprises a polyoxyethylene ether or ester (I), not in the form of a vesicle, pharmaceutically acceptable excipient and an antigen (Ag) or antigenic composition. The vaccine can be used to treat or prevent infections (by bacteria, viruses or other parasites), allergy and cancer. (I), which are safe, easy to testilize and simple to administer, are powerful vaccine adjuvants, able to induce a systemic immune response when administered (non-invasivally) to the mucosa. The response is at least as good as that from conventional systemic injection. (I) are effective at low concentration, have low
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CpG-N motif; immunostimulation; antigen; CpG-S motif; immunisation; ODN; viral antigen; bacterial antigen; parasite; therapeutic; growth factor; toxin; tumour suppressor; cytokine; apoptotic protein; interferon; hormone; clotting factor; ligand; receptor; oligodeoxynucleotide; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPW (represented in AAX72515-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce an immune response in a partient to an HPV antigen. They can also be used for preventing or treating HPV induced tumours. This sequence represents a CpG oligonucleotide which is used in the method of the invention
                                                                                                                                                                                                                          Fusion protein; B6 protein; E7 protein; B6/E7; immunomodulator; tumour; immunological fusion partner; CpG oligonucleotide; immune response; HPV antigen; prevention; treatment; primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CpG adjuvant; vaccine; polyoxyethylene ether; polyoxyethylene ester; antigen; infection; allergy; cancer; therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Composition comprising an E6, E7 or E6/E7 fusion protein from HPV to induce immune response to HPV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

AAV74237-V74253 are oligodeoxynucleotide (ODN) primers used to describe a method for enhancing the immunostimulatory effect of an antigen encoded by nucleic acid contained in a nucleic acid construct. The method involves determining the CpG-N and CpG-S motifs present in the construct,
                                                             AAV74237-V74253 are oligodeoxynucleotide (ODN) primers used to describe a method for enhancing the immunostimulatory effect of an antigen encoded by nucleic acid contained in a nucleic acid construct. The method involves determining the CpG-N and CpG-S motifs present in the construct, removing neutralising CpG (CpG-N) motifs and optionally inserting stimulatory CpG (CpG-S) motifs in the construct, thereby producing a nucleic acid construct having enhanced immunostimulatory efficacy. The method can be used for immunisation against viral antigens, e.g. from hepatitis B virus (HBV), bacterial antigens or an antigen derived from a parasite. They can also be used for expression of a therapeutic polypeptide, e.g. growth factors, toxins, tumour suppressors, cytokines, apopytotic proteins, interferons, hormones, clotting factors, ligands and receptors.                                                                                                                                                                                                                                  AAV74237-V74253 are oligodeoxynucleotide (ODN) primers used to describe a method for enhancing the immunostimulatory effect of an antigen encoded by nucleic acid construct. The method involves determined in a nucleic acid construct. The method involves determining the CpG-N and CpG-S motifs present in the construct, removing neutralising CpG (CpG-N) motifs and optionally inserting stimulatory CpG (CpG-S) motifs in the construct, thereby producing a nucleic acid construct having enhanced immunostimulatory efficacy. The method can be used for immunisation against viral antigens, e.g. from hepatitis B virus (HBV), bacterial antigens or an antigen derived from a parasite. They can also be used for expression of a therapeutic polypeptide, e.g. growth factors, toxins, tumour suppressors, cytokines, apoptocic proteins, interferons, hormones, clotting factors, ligands and receptors. The present sequence represent a specifically claimed CpG oligonucleotide. A vaccine composition comprising the formulation is used for inducing a immune response to T-independent type 1 or type 2 antigen or polysaccharide conjugate antigen. The use of immunostimulatory CpG oligonucleotide acts
removing neutralising CpG (CpG-N) motifs and optionally inserting atimulatory CpG (CpG-S) motifs in the construct, thereby producing a nucleic acid construct having enhanced immunostimulatory efficacy. The method can be used for immunisation against viral antigens, e.g. from hepatitis B virus (HBV), bacterial antigens or an antigen derived from a parasite. They can also be used for expression of a therapeutic polypeptide, e.g. growth factors, toxins, tumour suppressors, cytokines, apoptotic proteins, interferons, hormones, clotting factors, ligands and receptors. (Updated on 20-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A vaccine composition for inducing a immune response to T-independent type 1 or type 2 antigen or polysaccharide conjugate antigen.

This oligonuclectide contains a CpG motif. It was tested for its ability to act as an adjuvant for the MTA-alpha peptide (AAX42723), which can induce inflammatory cardiomyopathy (ICM) in mice. It was found to act as a potent immunostimulator, whereas a oligonuclectide from the same source which did not contain a CpG motif (AAZ28193) was hardly effective as an adjuvant. Inflammatory cardiomyopathy peptides (AAX42723, AAX42725-1842731) can be used with such an adjuvant and an excipient in a vaccine for decreasing ICM

AAZ60931-Z61015 represent immunostimulatory stereoisomers of CpG
oligonucleotides. The sequences are derived from generic nucleic acid
sequence, from which immunoihibitory sequences may also be derived. The
immunostimulatory nucleic acids can be co-administered with an antigen to
cuduce an antigen-specific immune response. The immunostimulatory nucleic
acids can also be used in methods for redirecting a subject's immune
cc capponse from a Th2 to a Th1, for treating asthma, for desensitising a
cc subject against the occurrence of an allergic reaction in response to
cc nucleat with an allergen, for activating an immune cell, especially a
lymphocyte or a dendritic cell expressing a cancer antigen or for
treating cancer. The immunoihibitory nucleic acid can be used to prevent
cc in immune response, especially where the immune response in the subject
is excessive due to having received an immune stimulating compound. The
immunoihibitory nucleic acid can be used to treat a subject having or at
inflammatory disease, especially inflammatory bowel disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Haematopoiesis; regulation, CpG oligonucleotide; phosphorothioate; immune remodeling; thrombopoiesis; anaemia; immune system; cancer; immune response; allergic reaction; infectious disease; asthma; thrombocytopaenia; immunchaemolytic disorder; panetic disorder; haemoglobinopathy; kidney failure; chronic inflammatory disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Signature of the sequences are derived from generic nucleic acid sequence, from which immunoinhibitory sequences may also be derived. The sequences read an interest nucleic acids can be co-administered with an anticen to acids can anticent of the immunostimulatory nucleic acids can anticent of the immunostimulatory nucleic acids can also be used in methods for redirecting a subject's immune response from a Th2 to a Th1, for treating asthma, for desensitising a subject against the occurrence of an allergic reaction in response to contact with an allergen, for activating an immune call, especially a lymphocyte or a dendritic call expressing a cancer antigen or for treating cancer. The immunoinhibitory nucleic acid can be used to prevent an immune response, especially where the immune response in the subject is excessive due to having received an immune stimulating compound. The
